What was one major unintended drawback linked to the CoWIN registration system?

Read the passage and answer the following questions.

India's COVID-19 vaccination programme—vast in ambition and reach—had to navigate a web of logistical hurdles, social resistance, and policy-level pressures. With a population exceeding a billion, the country had to deliver doses amid shifting supplies, uneven healthcare infrastructure, and varying levels of public confidence. Early distribution patterns were notably uneven: metropolitan regions received a larger share of vaccines compared to rural and remote areas. This gap was driven by centralized decision-making as well as practical constraints like weak cold-chain networks outside cities. In many far-flung locations, unreliable electricity, limited storage, and difficult transport routes made safe delivery challenging. Alongside this, vaccine doubt grew as false claims circulated online, amplifying fears about side effects or alleged motives—particularly through local-language channels. CoWIN, the digital system for registration, was a major step forward, but it also unintentionally left out many who lacked smartphones, internet access, or the skills to use such platforms, widening the digital divide. Over time, the approach was adjusted through greater state-level involvement, community outreach via trusted local and religious figures, and the use of mobile vaccination teams to reach underserved populations. Meanwhile, domestic manufacturing—especially Covishield and Covaxin—reduced reliance on external supply lines and supported “Vaccine Maitri” diplomacy. In the end, the campaign revealed India's ability to mobilize at scale while underlining the importance of trust-building, infrastructure strength, and inclusive planning in a digitally unequal society.

- A. It worsened network speed in villages
  - B. It caused official vaccination records to be incomplete
  - C. It left out citizens with low digital awareness
  - D. It resulted in frequent cyber-attacks on user accounts
- 

## Q84.

According to the passage, why did cities get a larger share of vaccines in the early phase?

- A. Urban facilities produced more vaccines than rural centres
  - B. Overseas supply disruptions alone created urban preference
  - C. Rural communities rejected vaccination in large numbers
  - D. Centralized control and weak rural logistics tilted allocation toward cities
- 

## Q85.

Which step mentioned in the passage helped address vaccine rumours and hesitancy?

- A. Enforcing a nationwide ban on social media platforms
- B. Relying on community figures and mobile vaccination outreach
- C. Depending only on vaccines sourced from abroad
- D. Limiting access to local news in rural regions
